

Introduction

Each quarterly issue of *Seminars in Cutaneous Medicine and Surgery* includes in-depth discussions of interest and importance to medical and procedural dermatologists. Typically, the editors select a guest editor who organizes each issue around a specific topic. The guest editor identifies and recruits knowledgeable experts to write reviews and overviews about the state of the art in specific subject areas. The experts, in turn, address the current concepts and limits of our knowledge of the topic.

Every few years, the editors take the opportunity to look back and identify the best articles from the recent past. We select articles that we think are outstanding and worth reading again because they are so well done and considered important topics of continuing relevance.

This issue features a selection of some of the well-crafted and informative articles from recent issues, including a discussion of botulinum toxins, complications in dermatologic

surgery, corticosteroid-induced osteoporosis, the relationship of isotretinoin and depression, epidermal nevus syndromes, and the treatment modalities and management options with congenital melanocytic nevi.

We hope you enjoy the look back at some of the best articles recently published in *Seminars in Cutaneous Medicine and Surgery*. We also invite you to plan to look forward to the information presented in future issues of this journal as we take new strides to bring you balanced, expert perspectives on advances in dermatology.
